

Password Strength Checker - Project 1 Report

Objective: Create a program that checks whether a password is weak, medium, or strong based on length, uppercase letters, digits, and symbols.

Python Code

```
import re
pwd=input('Enter password: ')
score=0
if len(pwd)>=8: score+=1
if re.search(r'[A-Z]',pwd): score+=1
if re.search(r'[0-9]',pwd): score+=1
if re.search(r'^A-Za-z0-9!',pwd): score+=1
print('Weak' if score<=1 else 'Medium' if score<=3 else 'Strong')
```

Sample Output

Password: Hello123! -> Strong
Password: hello12 -> Medium
Password: abc -> Weak

Conclusion: The program evaluates password strength using basic security rules and demonstrates string handling and conditional logic.
